

## AUSTRALIAN PRODUCT INFORMATION

### Kadcyla<sup>®</sup> (trastuzumab emtansine)

WARNING: Do not substitute Kadcyla for or with trastuzumab. In order to prevent medication errors, check the vial labels to ensure the medicine being prepared and administered is Kadcyla (trastuzumab emtansine) and not trastuzumab.

#### 1. NAME OF THE MEDICINE

trastuzumab emtansine

#### 2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Kadcyla is available as a single-use vial containing 100 mg or 160 mg of trastuzumab emtansine.

For the full list of excipients, *see section 6.1 List of excipients.*

#### 3. PHARMACEUTICAL FORM

Powder for concentrate for solution for infusion.

White to off-white lyophilised powder.

#### 4. CLINICAL PARTICULARS

##### 4.1 THERAPEUTIC INDICATIONS

###### Early Breast Cancer

Kadcyla, as a single agent, is indicated for the adjuvant treatment of patients with HER2-positive early breast cancer who have residual invasive disease after neoadjuvant taxane and trastuzumab-based treatment.

###### Metastatic Breast Cancer

Kadcyla, as a single agent, is indicated for the treatment of patients with HER2-positive metastatic (Stage IV) breast cancer who previously received trastuzumab and a taxane, separately or in combination. Patients should have either:

- Received prior therapy for metastatic disease, or
- Developed disease recurrence during or within six months of completing adjuvant therapy.

## 4.2 DOSE AND METHOD OF ADMINISTRATION

Patients treated with Kadcyla should have HER2 positive tumour status, defined as a score of 3+ by immunohistochemistry (IHC) or a ratio of  $\geq 2.0$  by in situ hybridization (ISH) assessed by a validated test.

Kadcyla therapy should only be administered under the supervision of a healthcare professional experienced in the treatment of cancer patients.

**In order to prevent medication errors, it is important to check the vial labels to ensure the medicine being prepared and administered is Kadcyla (trastuzumab emtansine) and not trastuzumab.**

In order to improve traceability of biological medicinal products, the trade name and batch number of the administered product should be clearly recorded in the patient medical record.

### Dosage

The recommended dose of Kadcyla is 3.6 mg/kg, administered as an intravenous (IV) infusion every 3 weeks (21-day cycle).

### Duration of treatment

Patients with early breast cancer should receive treatment for a total of 14 cycles unless there is disease recurrence or unmanageable toxicity.

Patients with metastatic breast cancer should receive treatment until disease progression or unmanageable toxicity.

### Missed dose

If a planned dose of Kadcyla is missed, it should be administered as soon as possible; do not wait until the next planned cycle. The schedule of administration should be adjusted to maintain a 3-week interval between doses. The infusion may be administered at the rate the patient tolerated the most recent infusion.

### Method of Administration

For instructions on reconstitution and dilution of the product before administration, *see section 6.6 Special precautions for disposal and other handling*.

Kadcyla must be reconstituted and diluted by a healthcare professional and administered as an IV infusion. Do not administer as an IV push or bolus.

Once the infusion solution is prepared, it should be administered immediately.

If 0.45% sodium chloride is used, the infusion can be administered without a 0.22 micron in-line polyethersulfone (PES) filter. If 0.9% sodium chloride is used, a 0.22 micron in-line PES filter is required for administration of the infusion.

If the infusion solution is not used immediately, the infusion solution can be stored for up to 24 hours at 2°C - 8°C (*see section 6.4 Special precautions for storage*).

Administer the initial dose as a 90 minute IV infusion. Patients should be observed during the infusion and for at least 90 minutes following the initial dose for fever, chills, or other infusion related reactions. The infusion site should be closely monitored for possible subcutaneous

infiltration during Kadcyła administration (*see section 4.4 Special warnings and precautions for use; Extravasation*).

If prior infusions were well tolerated, subsequent doses of Kadcyła may be administered as a 30 minute infusion and patients should be observed during the infusions and for at least 30 minutes after the infusion. The infusion rate of Kadcyła should be slowed or interrupted if the patient develops infusion-related symptoms (*see section 4.4 Special warnings and precautions for use; Infusion-Related Reactions, Hypersensitivity*). Discontinue Kadcyła for life-threatening infusion reactions.

### **Dosage adjustment**

Management of symptomatic adverse events may require temporary interruption, dose reduction, or treatment discontinuation of Kadcyła as per guidelines provided below in Tables 1-3.

Kadcyła dose should not be re-escalated after a dose reduction is made.

**Table 1 Dose Reduction Schedule**

<b>Dose reduction Schedule</b>	<b>Dose Level</b>
<i>Starting Dose</i>	3.6 mg/kg
<i>First dose reduction</i>	3 mg/kg
<i>Second dose reduction</i>	2.4 mg/kg
<i>Requirement for further dose reduction</i>	Discontinue treatment

**Table 2 Dose Modification Guidelines for Patients with Early Breast Cancer***(see section 4.4 Special warnings and precautions for use)*

<b>Adverse reaction</b>	<b>Severity</b>	<b>Treatment modification</b>
Increased Alanine Transaminase (ALT)	Grade 2-3 ( $> 3.0$ to $\leq 20 \times$ ULN on day of scheduled treatment)	Do not administer Kadcyła until ALT recovers to Grade $\leq 1$ , and then reduce one dose level
	Grade 4 ( $> 20 \times$ ULN at any time)	Discontinue Kadcyła
Increased Aspartate Transaminase (AST)	Grade 2 ( $> 3.0$ to $\leq 5 \times$ ULN on day of scheduled treatment)	Do not administer Kadcyła until AST recovers to Grade $\leq 1$ , and then treat at the same dose level
	Grade 3 ( $> 5$ to $\leq 20 \times$ ULN on day of scheduled treatment)	Do not administer Kadcyła until AST recovers to Grade $\leq 1$ , and then reduce one dose level
	Grade 4 ( $> 20 \times$ ULN at any time)	Discontinue Kadcyła
Hyperbilirubinemia	TBILI $> 1.0$ to $\leq 2.0 \times$ the ULN on day of scheduled treatment	Do not administer Kadcyła until total bilirubin recovers to $\leq 1.0 \times$ ULN, and then reduce one dose level
	TBILI $> 2 \times$ ULN at any time	Discontinue Kadcyła
Nodular Regenerative Hyperplasia (NRH)	All Grades	Permanently discontinue Kadcyła
Thrombocytopenia	Grade 2-3 on day of scheduled treatment ( $25,000$ to $< 75,000/\text{mm}^3$ )	Do not administer Kadcyła until platelet count recovers to $\leq$ Grade 1 ( $\geq 75,000/\text{mm}^3$ ), and then treat at the same dose level. If a patient requires 2 delays due to thrombocytopenia, consider reducing dose by one level.
	Grade 4 at any time $< 25,000/\text{mm}^3$	Do not administer Kadcyła until platelet count recovers to $\leq$ Grade 1 ( $\geq 75,000/\text{mm}^3$ ), and then reduce one dose level.

<b>Adverse reaction</b>	<b>Severity</b>	<b>Treatment modification</b>
Left Ventricular Dysfunction	LVEF < 45%	Do not administer Kadcyła Repeat LVEF assessment within 3 weeks. If LVEF < 45% is confirmed, discontinue Kadcyła.
	LVEF 45% to < 50% and decrease is ≥ 10% points from baseline*	Do not administer Kadcyła Repeat LVEF assessment within 3 weeks. If the LVEF remains < 50% and has not recovered to < 10% points from baseline, discontinue Kadcyła.
	LVEF 45% to < 50% and decrease is < 10% points from baseline*	Continue treatment with Kadcyła. Repeat LVEF assessment within 3 weeks.
	LVEF ≥ 50%	Continue treatment with Kadcyła.
Heart Failure	Symptomatic CHF, Grade 3-4 LVSD or Grade 3-4 heart failure, or Grade 2 heart failure accompanied by LVEF < 45%	Discontinue Kadcyła.
Peripheral Neuropathy	Grade 3-4	Do not administer Kadcyła until resolution ≤ Grade 2.
Pulmonary Toxicity	Interstitial lung disease (ILD) or pneumonitis	Permanently discontinue Kadcyła.
Radiotherapy-Related Pneumonitis	Grade 2	Discontinue Kadcyła if not resolving with standard treatment.
	Grade 3-4	Discontinue Kadcyła.

ALT: alanine transaminase, AST: aspartate transaminase, CHF: congestive heart failure, LVEF: left ventricular ejection fraction, LVSD: left ventricular systolic dysfunction, TBILI: Total Bilirubin, ULN: upper limit of normal

\*Prior to starting Kadcyła treatment.

**Table 3 Dose Modification Guidelines for Patients with Metastatic Breast Cancer***(see section 4.4 Special warnings and precautions for use)*

<b>Adverse reaction</b>	<b>Severity</b>	<b>Treatment modification</b>
Increased Transaminase (AST/ALT)	Grade 2 ( $> 2.5$ to $\leq 5 \times$ the ULN)	Treat at the same dose level.
	Grade 3 ( $> 5$ to $\leq 20 \times$ the ULN)	Do not administer Kadcyła until AST/ALT recovers to Grade $\leq 2$ , and then reduce one dose level.
	Grade 4 ( $> 20 \times$ the ULN)	Discontinue Kadcyła.
Hyperbilirubinemia	Grade 2 ( $> 1.5$ to $\leq 3 \times$ the ULN)	Do not administer Kadcyła until total bilirubin recovers to Grade $\leq 1$ , and then treat at the same dose level.
	Grade 3 ( $> 3$ to $\leq 10 \times$ the ULN)	Do not administer Kadcyła until total bilirubin recovers to Grade $\leq 1$ and then reduce one dose level.
	Grade 4 ( $> 10 \times$ the ULN)	Discontinue Kadcyła.
Drug Induced Liver Injury (DILI)	Serum transaminases $> 3 \times$ ULN and concomitant total bilirubin $> 2 \times$ ULN	Permanently discontinue Kadcyła in the absence of another likely cause for the elevation of liver enzymes and bilirubin, e.g. liver metastasis or concomitant medication.
Thrombocytopenia	Grade 3 (25,000 to $< 50,000/\text{mm}^3$ )	Do not administer Kadcyła until platelet count recovers to $\leq$ Grade 1 ( $\geq 75,000/\text{mm}^3$ ), and then treat at the same dose level.
	Grade 4 ( $< 25,000/\text{mm}^3$ )	Do not administer Kadcyła until platelet count recovers to $\leq$ Grade 1 ( $\geq 75,000/\text{mm}^3$ ), and then reduce one dose level.
Left Ventricular Dysfunction	Symptomatic CHF	Discontinue Kadcyła.
	LVEF $< 40\%$	Do not administer Kadcyła. Repeat LVEF assessment within 3 weeks. If LVEF $< 40\%$ is confirmed, discontinue Kadcyła.
	LVEF $40\%$ to $\leq 45\%$ and decrease is $\geq 10\%$ points from baseline	Do not administer Kadcyła. Repeat LVEF assessment within 3 weeks. If the LVEF has not recovered to within 10% points from baseline, discontinue Kadcyła.
	LVEF $40\%$ to $\leq 45\%$ and decrease is $< 10\%$ points from baseline	Continue treatment with Kadcyła. Repeat LVEF assessment within 3 weeks.
	LVEF $> 45\%$	Continue treatment with Kadcyła.

<b>Adverse reaction</b>	<b>Severity</b>	<b>Treatment modification</b>
Nodular Regenerative Hyperplasia (NRH)	All Grades	Permanently discontinue Kadcyła
Pulmonary Toxicity	Interstitial lung disease (ILD) or pneumonitis	Permanently discontinue Kadcyła
Peripheral Neuropathy	Grade 3-4	Do not administer Kadcyła until resolution Grade $\leq 2$

ALT: alanine transaminase, AST: aspartate transaminase, DILI: Drug Induced Liver Injury, LVEF: left ventricular ejection fraction, NRH: Nodular regenerative hyperplasia, ULN: upper limit of normal

### Special populations

#### *Elderly*

There are insufficient data to establish the safety and efficacy of Kadcyła in patients 75 years of age or older. No dose adjustment of Kadcyła is required in patients aged  $\geq 65$  years (*see section 4.4 Special warnings and precautions for use; Use in the Elderly*).

#### *Renal impairment*

No adjustment to the starting dose of Kadcyła is needed in patients with mild or moderate renal impairment (*see section 5.2 Pharmacokinetic properties; Pharmacokinetics in Special Populations*). The potential need for dose adjustment in patients with severe renal impairment cannot be determined due to insufficient data.

#### *Hepatic impairment*

No adjustment to the starting dose is required for patients with mild or moderate hepatic impairment (*see section 5.2 Pharmacokinetic properties, Pharmacokinetics in Special Populations*). Kadcyła has not been studied in patients with severe hepatic impairment. Treatment of patients with hepatic impairment should be undertaken with caution due to known hepatotoxicity observed with Kadcyła (*see section 4.4 Special warnings and precautions for use; Hepatotoxicity*).

#### *Paediatric population*

The safety and efficacy of Kadcyła in children below 18 years of age have not been established.

### **4.3 CONTRAINDICATIONS**

Kadcyła is contraindicated in patients with a known hypersensitivity to Kadcyła or any of its excipients (*see section 4.4 Special warnings and precautions for use; Infusion-Related Reactions and Hypersensitivity Reactions*).

## 4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE

### General

Patients treated with Kadcyla must have confirmed HER2-positive tumour status as assessed by either HER2 protein over-expression or gene amplification.

### Pulmonary Toxicity

Cases of interstitial lung disease (ILD), including pneumonitis, some leading to acute respiratory distress syndrome or a fatal outcome, have been reported in clinical trials with Kadcyla (*see section 4.8 Adverse effects (Undesirable effects)*). Signs and symptoms include dyspnoea, cough, fatigue, and pulmonary infiltrates.

It is recommended that treatment with Kadcyla be permanently discontinued in patients who are diagnosed with ILD or pneumonitis, except for radiation pneumonitis in the adjuvant setting, where Kadcyla should be permanently discontinued for  $\geq$  Grade 3 or for Grade 2 not responding to standard treatment (*see section 4.2 Dose and method of administration*).

Patients with dyspnoea at rest due to complications of advanced malignancy, co-morbidities, and receiving concurrent pulmonary radiation therapy may be at increased risk of pulmonary events.

### Hepatotoxicity

Serious hepatotoxicity has been reported, including liver failure and death, in patients treated with Kadcyla. Hepatotoxicity has been observed predominantly in the form of asymptomatic increases in the concentrations of serum transaminases (Grade 1-4 transaminitis) in clinical trials (*see section 4.8 Adverse effects (Undesirable effects)*). Transaminase elevations were generally transient with peak elevation at day 8 after therapy and subsequent recovery to Grade 1 or less prior to the next cycle. A cumulative effect of Kadcyla on transaminases has also been observed. Patients with elevated transaminases improved to Grade 1 or normal within 30 days of the last dose of Kadcyla in the majority of the cases. Serious hepatobiliary disorders, including nodular regenerative hyperplasia (NRH) of the liver and some with a fatal outcome due to drug-induced liver injury have been observed in patients treated with Kadcyla in clinical trials. Observed cases may have been confounded by comorbidities and/or concomitant medications with known hepatotoxic potential.

Monitor serum transaminases and bilirubin prior to initiation of Kadcyla treatment and prior to each Kadcyla dose. Reduce the dose or discontinue Kadcyla as appropriate in cases of increased serum transaminases and/or total bilirubin (*see section 4.2 Dose and method of administration; Dose adjustments*). Kadcyla has not been studied in patients with serum transaminases  $> 2.5$  x ULN (upper limit of normal) or total bilirubin  $> 1.5$  x ULN prior to initiation of treatment, except in a dedicated pharmacology study of the use of Kadcyla in hepatic impairment (*see section 5.2 Pharmacokinetic properties, Pharmacokinetics in special populations*). Two out of ten patients with mild hepatic impairment withdrew from the study due to increased levels of bilirubin, and one patient with moderate hepatic impairment developed fatal hepatic encephalopathy, considered to be at least partly related to trastuzumab emtansine. Permanently discontinue Kadcyla treatment in patients with serum transaminases  $> 3$  x ULN and concomitant total bilirubin  $> 2$  x ULN.

Cases of NRH of the liver have been identified from liver biopsies in patients treated with Kadcyla. NRH is a rare liver condition characterised by widespread benign transformation of hepatic parenchyma into small regenerative nodules; NRH may lead to non-cirrhotic portal

hypertension. Diagnosis of NRH can be confirmed only by histopathology. NRH should be considered in all patients with clinical symptoms of portal hypertension and/or cirrhosis-like pattern seen on the computed tomography (CT) scan of the liver but with normal transaminases and no other manifestations of cirrhosis. Upon diagnosis of NRH, Kadcyła treatment must be permanently discontinued.

### **Left Ventricular Dysfunction**

Kadcyła may lead to reductions in left ventricular ejection fraction (LVEF). LVEF < 40% has been observed in patients treated with Kadcyła. Symptomatic congestive heart failure (CHF) is a potential risk. In the phase III study TDM4370g/BO21977 (EMILIA), left ventricular dysfunction occurred in 1.8% of patients in the Kadcyła-treated group and 3.3% of patients in the lapatinib plus capecitabine-treated group (*see section 4.8 Adverse effects (Undesirable effects)*).

Assess LVEF (echocardiogram or multigated acquisition (MUGA) scanning) prior to initiation and at regular intervals (e.g. every three months) during treatment with Kadcyła to ensure LVEF is within the institution's normal limits.

Events of LVEF drop of >10% from baseline and/or CHF were observed in approximately 22% of patients with MBC in an observational study (BO39807) with baseline LVEF of 40-49% in a real world setting. Most of these patients had other cardiovascular risk factors. The decision to administer Kadcyła in patients with MBC with low LVEF must be made only after careful benefit risk assessment and cardiac function should be closely monitored in these patients.

Specific guidelines regarding dose modifications and discontinuation are provided in *section 4.2 Dose and method of administration; Dosage adjustments*.

### **Infusion-Related Reactions**

Treatment with Kadcyła has not been studied in patients who had trastuzumab permanently discontinued due to infusion-related reactions (IRR); treatment with Kadcyła is not recommended for these patients.

Infusion-related reactions, characterised by one or more of the following symptoms - flushing, chills, pyrexia, dyspnoea, hypotension, wheezing, bronchospasm, and tachycardia - have been reported in clinical trials of Kadcyła. In general, these symptoms were not severe (*see section 4.8 Adverse effects (Undesirable effects)*). In most patients, these reactions resolved over the course of several hours to a day after the infusion was terminated. Kadcyła treatment should be interrupted in patients with severe IRR. Kadcyła treatment should be permanently discontinued in the event of a life threatening infusion-related reaction (*see section 4.2 Dose and method of administration; Dosage adjustments*).

### **Hypersensitivity Reactions**

Patients should be observed closely for hypersensitivity reactions, especially during the first infusion. Hypersensitivity, including serious, anaphylactic like reactions, has been observed in clinical trials with treatment of Kadcyła. Medications to treat such reactions, as well as emergency equipment, should be available for immediate use.

### **Haemorrhage**

Cases of haemorrhagic events, including central nervous system, respiratory, and gastrointestinal haemorrhage, have been reported with Kadcyła treatment. Some of these bleeding events resulted in fatal outcomes. In some of the observed cases the patients had

thrombocytopenia, or were also receiving anti-coagulation therapy or antiplatelet therapy; in others there were no known additional risk factors. Use caution with these agents and consider additional monitoring when concomitant use is medically necessary.

### **Thrombocytopenia**

Thrombocytopenia, or decreased platelet counts, was reported in patients in clinical trials of Kadcyła. The majority of these patients had Grade 1 or 2 events ( $\geq 50,000/\text{mm}^3$ ), with the nadir occurring by day 8 and generally improving to grade 0 or 1 ( $\geq 75,000/\text{mm}^3$ ) by the next scheduled dose. In clinical trials, the incidence and severity of thrombocytopenia were higher in Asian patients.

In the phase III study TDM4370g/BO21977 (EMILIA) in patients with metastatic breast cancer, the overall frequency of thrombocytopenia was 31.2% in the Kadcyła-treated group and 3.3% in the lapatinib plus capecitabine-treated group (*see section 4.8 Adverse effects (Undesirable effects)*). The incidence of  $\geq$  Grade 3 thrombocytopenia was 14.5% in the Kadcyła-treated group and 0.4% in the lapatinib plus capecitabine-treated group. In Asian patients, the incidence of  $\geq$  Grade 3 thrombocytopenia was 45.1% in the Kadcyła-treated group and 1.3% in the lapatinib plus capecitabine-treated group.

Thrombocytopenia was reported in 28.5% of early breast cancer patients treated with Kadcyła in study BO27938 (KATHERINE). Independent of race, the incidence of Grade 3 or 4 events ( $< 50,000/\text{mm}^3$ ) was 5.7% in the Kadcyła-treated group. The overall frequency of thrombocytopenia in Asian patients in the Kadcyła-treated group in study BO27938 (KATHERINE) was 50.0% and that of Grade 3 or 4 thrombocytopenia was 18.8%.

Patients with thrombocytopenia ( $< 100,000/\text{mm}^3$ ) and patients on anti-coagulant treatment should be monitored closely while on Kadcyła treatment. It is recommended that platelet counts are monitored prior to each Kadcyła dose. Kadcyła has not been studied in patients with platelet counts  $\leq 100,000/\text{mm}^3$  prior to initiation of treatment. In the event of decreased platelet count to Grade 3 or greater ( $< 50,000/\text{mm}^3$ ), do not administer Kadcyła until platelet counts recover to Grade 1 ( $\geq 75,000/\text{mm}^3$ ). Please see *section 4.2 Dose and method of administration; Dosage adjustments*.

### **Neurotoxicity**

Peripheral neuropathy, mainly Grade 1 and predominantly sensory, has been reported in clinical trials of Kadcyła. Treatment with Kadcyła should be temporarily discontinued in patients experiencing Grade 3 or 4 peripheral neuropathy until symptoms resolve or improve to  $\leq$  Grade 2. Patients should be clinically monitored on an ongoing basis for signs/symptoms of neurotoxicity.

In the phase III study TDM4370g/BO21977 (EMILIA) in patients with metastatic breast cancer, the overall incidence of peripheral neuropathy was 23.3% and 3.1% for Grade  $\geq 3$ .

In patients with early breast cancer in study BO27938 (KATHERINE), the overall incidence was 32.3% and 1.6% for Grade  $\geq 3$ . Onset of the Grade 3 event of peripheral neuropathy ranged between Study Day 2 and Day 229, with a median of 60 days. In 50% of patients who experienced Grade 3 peripheral neuropathy, these events had resolved at the time of the primary IDFS analysis, while events were resolving in 25% of the patients.

### **Extravasation**

In Kadcyła clinical studies, reactions secondary to extravasation have been observed. These reactions were usually mild and comprised of erythema, tenderness, skin irritation, pain, or swelling at the infusion site. These reactions have been observed more frequently within 24 hours of infusion. Specific treatment for Kadcyła extravasation is unknown at this time. The infusion site should be closely monitored for possible subcutaneous infiltration during drug administration.

### **Use in hepatic impairment**

Please see section 5.2 Pharmacokinetic properties; Pharmacokinetics in Special Populations.

### **Use in renal impairment**

No formal studies of Kadcyła in patients with renal impairment have been conducted (*see Section 5.2 Pharmacokinetic properties; Pharmacokinetics in Special Populations*).

### **Use in the Elderly**

There are insufficient data to establish the safety and efficacy of Kadcyła in patients 75 years of age or older (*see section 5.1 Pharmacodynamic properties; Clinical Trials; TDM4370g/BO21977 (EMILIA)*). Based on a population pharmacokinetic analysis, age does not affect the pharmacokinetics of Kadcyła.

### **Paediatric use**

The safety and efficacy of Kadcyła in children below 18 years of age have not been established.

### **Effects on laboratory tests**

Please see section 4.4 Special warnings and precautions for use; Hepatotoxicity and Thrombocytopenia.

## **4.5 INTERACTION WITH OTHER MEDICINES AND OTHER FORMS OF INTERACTION**

No formal drug-drug interaction studies with Kadcyła in humans have been conducted.

*In vitro* metabolism studies in human liver microsomes suggest that DM1, the cytotoxic component of trastuzumab emtansine, is metabolised mainly by CYP3A4 and, to a lesser extent, by CYP3A5. DM1 does not induce or inhibit P450-mediated metabolism *in vitro*. Plasma DM1 concentrations may be affected by CYP3A4/5 inhibitors or inducers. Thus, patients who are receiving strong CYP3A4/5 inhibitors (e.g. ketoconazole, itraconazole, voriconazole, clarithromycin, telithromycin) concomitantly with trastuzumab emtansine should be closely monitored for adverse reactions.

## **4.6 FERTILITY, PREGNANCY AND LACTATION**

### **Effects on Fertility**

The effects of trastuzumab emtansine on human fertility are unknown. No dedicated fertility studies have been conducted with trastuzumab emtansine. However, based on results from rat toxicity studies, adverse effects on fertility may occur.

Single-dose toxicity studies of trastuzumab emtansine in rats demonstrated adverse effects on reproductive organs. Male rats exhibited degeneration of seminiferous tubules in the testes and luminal debris in the epididymides at 60 mg/kg (approximately 9-times the anticipated clinical trastuzumab emtansine exposure, based on AUC). At the same dose in female rats,

haemorrhage and necrosis of the corpus luteum in the ovaries and mammary gland degeneration and necrosis was observed. Mammary gland degeneration and necrosis was also observed in males at doses from 20 mg/kg (3-fold the anticipated clinical trastuzumab emtansine exposure, based on AUC).

#### **Use in pregnancy (Category D)**

Trastuzumab emtansine can result in embryo-foetal death or birth defects when administered to a pregnant woman. There are no clinical studies of trastuzumab emtansine in pregnant women. No reproductive and developmental toxicology studies have been conducted with trastuzumab emtansine. Trastuzumab, a component of trastuzumab emtansine, can cause foetal harm or death when administered to pregnant women. In the post-marketing setting, cases of oligohydramnios, some associated with fatal pulmonary hypoplasia, have been reported in pregnant women receiving trastuzumab. DM1, the cytotoxic component of trastuzumab emtansine, is a microtubule inhibitory drug derived from maytansine. Based on animal studies of maytansine, DM1, is expected to be teratogenic and potentially embryotoxic.

Administration of trastuzumab emtansine to pregnant women is not recommended. Women of child bearing potential and female partners of male patients of child bearing potential should be advised to use effective contraception during treatment with trastuzumab emtansine and for at least 7 months following the last dose of trastuzumab emtansine. Women who become pregnant must contact their doctor and should be advised of the possibility of harm to the foetus. If a pregnant woman is treated with trastuzumab emtansine, close monitoring by a multidisciplinary team is recommended.

#### **Use in lactation**

It is not known whether trastuzumab emtansine is excreted in human breast milk.

However, trastuzumab was shown to be readily transferred through the placenta (foetal amniotic fluid and sera samples around 20-30% of maternal plasma concentrations), with a small amount (2% of maternal plasma concentrations) excreted in the milk of monkeys after IV doses of 25 mg/kg for 4 consecutive days from gestation day 120 followed by twice weekly until post-partum day 28.

Since many drugs are excreted in human breast milk, and because of the potential for serious adverse reactions in nursing infants from trastuzumab emtansine, women should discontinue nursing prior to initiating treatment with trastuzumab emtansine. Women may begin nursing 7 months following the last dose of Kadcyla.

#### **4.7 EFFECTS ON ABILITY TO DRIVE AND USE MACHINES**

On the basis of reported adverse reactions, Kadcyla has no or negligible influence on the ability to drive and use machines. The significance of reported adverse reactions such as fatigue, headache, dizziness and blurred vision on the ability to drive or use machines is unknown. Patients experiencing infusion-related reactions (flushing, shivering fits, fever, trouble breathing, low blood pressure or a rapid heartbeat) should be advised not to drive and use machines until symptoms abate.

## 4.8 ADVERSE EFFECTS (UNDESIRABLE EFFECTS)

### Clinical Trials

#### Early Breast Cancer

The safety of Kadcyła has been evaluated in 740 patients with early breast cancer in Study BO27938 KATHERINE. Adverse drug reactions from KATHERINE (Table 4) are listed by MedDRA system organ class. The corresponding frequency category for each adverse drug reaction is based on the following convention: very common ( $\geq 1/10$ ), common ( $\geq 1/100$  to  $< 1/10$ ), uncommon ( $\geq 1/1,000$  to  $< 1/100$ ), rare ( $\geq 1/10,000$  to  $< 1/1,000$ ), very rare ( $< 1/10,000$ ).

**Table 4 Adverse drug reactions occurring in patients treated with Kadcyła in Study BO27938 (KATHERINE)**

System Organ Class	All grades (%) n = 740	Grade 3 - 5 (%) n = 740	Frequency Category
<b>Blood and Lymphatic System Disorders</b>			
Thrombocytopenia	28.5	5.7	very common
Anaemia	10.1	1.1	very common

<b>Potassium</b>			
Decreased Potassium	26	2	< 1

#### Metastatic Breast Cancer

The safety of Kadcylla has been evaluated in more than 1,871 patients. Adverse drug reactions from clinical trials (Table 6) are listed by MedDRA system organ class. The corresponding frequency category for each adverse drug reaction is based on the following convention: very common ( $\geq 1/10$ ), common ( $\geq 1/100$  to  $< 1/10$ ), uncommon ( $\geq 1/1,000$  to  $< 1/100$ ), rare ( $\geq 1/10,000$  to  $< 1/1,000$ ), very rare ( $< 1/10,000$ ).

**Table 6 Adverse drug reactions occurring in patients treated with Kadcyła in clinical trials**

Decreased Neutrophils	41	4	< 1
<b>Potassium</b>			
Decreased Potassium	35	3	< 1

### Immunogenicity

As with all therapeutic proteins, there is the potential for an immune response to Kadcyła. A total of 1243 patients from seven clinical studies were tested at multiple time points for anti-drug antibody (ADA) responses to Kadcyła. Following Kadcyła dosing, 5.1% (63/1243) of patients tested positive for anti-Kadcyła antibodies at one or more post-dose time points. In the phase I and phase II studies, 6.4% (24/376) of patients tested positive for anti-Kadcyła antibodies.

In the EMILIA study (TDM4370g/BO21977), 5.2% (24/466) of patients tested positive for anti-Kadcyła antibodies, of which 13 were also positive for neutralising antibodies. In the KATHERINE (BO27938) study, 3.7% (15/401) of patients tested positive for anti-Kadcyła antibodies, of which 5 of were also positive for neutralising antibodies. Due to the low incidence of ADA, conclusions cannot be made on the impact of anti-Kadcyła antibodies on the pharmacokinetics, safety, and efficacy of Kadcyła.

Immunogenicity assay results are highly dependent on several factors including assay sensitivity and specificity, assay methodology, sample handling, timing of sample collection, drug interference, concomitant medications and underlying disease. For these reasons, comparison of the incidence of antibodies to Kadcyła with the incidence of antibodies to other products may be misleading.

### Reporting of suspected adverse reactions

Reporting suspected adverse reactions after registration of the medicinal product is important. It allows continued monitoring of the benefit-risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions at [www.tga.gov.au/reporting-problems](http://www.tga.gov.au/reporting-problems).

## 4.9 OVERDOSE

There is no known antidote for trastuzumab emtansine overdose. In case of overdose, the patient should be closely monitored. Cases of overdose have been reported with trastuzumab emtansine treatment, most associated with thrombocytopenia, and there was one death. In the fatal case, the patient incorrectly received trastuzumab emtansine 6 mg/kg and died approximately 3 weeks following the overdose; a cause of death and a causal relationship to Kadcyla were not established.

Treatment of overdose should consist of general supportive measures.

For information on the management of overdose, contact the Poison Information Centre (in Australia call 13 11 26; in New Zealand call 0800 764 766).

## 5. PHARMACOLOGICAL PROPERTIES

### 5.1 PHARMACODYNAMIC PROPERTIES

Pharmacotherapeutic group: Antineoplastic agent, other antineoplastic agents, monoclonal antibodies; ATC code: L01XC14

#### Mechanism of Action

Trastuzumab emtansine is a HER2-targeted antibody-drug conjugate, containing the humanised anti-HER2 IgG1 antibody trastuzumab, covalently linked to the small molecule cytotoxin, DM1. Upon binding to HER2, trastuzumab emtansine undergoes receptor-mediated internalisation and subsequent lysosomal degradation, resulting in release of DM1-containing cytotoxic catabolites.

Trastuzumab emtansine has the mechanisms of action of both trastuzumab and DM1

- Trastuzumab emtansine, like trastuzumab, binds to domain IV of the HER2 extracellular domain (ECD), as well as to Fcγ receptors and complement C1q. In addition, trastuzumab emtansine, like trastuzumab, inhibits shedding of the HER2 ECD, inhibits HER2 receptor signalling and mediates antibody-dependent cell-mediated cytotoxicity (ADCC) in human breast cancer cells that overexpress HER2.
- DM1, the cytotoxic component of Kadcyla, binds to tubulin. By inhibiting tubulin polymerisation, both DM1 and Kadcyla cause cells to arrest in the G2/M phase of the cell cycle, ultimately leading to apoptotic cell death.

#### Clinical trials

##### Early Breast Cancer

##### *BO27938 (KATHERINE)*

KATHERINE was a randomised, multicentre, open-label trial of 1486 patients with HER2-positive, early breast cancer with residual invasive tumour in the breast and/or axillary lymph nodes following taxane and trastuzumab-based therapy as part of a neoadjuvant regimen before trial enrolment. Patients received radiotherapy and/or hormonal therapy concurrent with study treatment as per local guidelines. Breast tumour samples were required to determine HER2 positive status defined as 3+ IHC or ISH amplification ratio  $\geq 2.0$  using a Pathway<sup>®</sup> HER2 (4B5) IHC assay and INFORM Dual ISH DNA Probe Cocktail (both Ventana) at a central laboratory. Patients were randomised (1:1) to receive trastuzumab or Kadcyla. Randomisation was stratified by clinical stage at presentation, hormone receptor status, preoperative HER2-

directed therapy (trastuzumab, trastuzumab plus additional HER2-directed agent[s]), and pathological nodal status evaluated after preoperative therapy.

Kadcyla was given intravenously at 3.6 mg/kg on Day 1 of a 21-day cycle. Trastuzumab was given intravenously at 6 mg/kg on Day 1 of a 21-day cycle. Patients were treated with Kadcyla or trastuzumab for a total of 14 cycles unless there was recurrence of disease, withdrawal of consent, or unacceptable toxicity, whichever occurred first. At the time of the primary analysis, median treatment duration was 10 months (range: 1–12) for Kadcyla, and median treatment duration 10 months (range: 1–13) for trastuzumab. Patients who discontinued Kadcyla could complete the duration of their intended study treatment up to 14 cycles of HER2-directed therapy with trastuzumab, if appropriate, based on toxicity considerations and investigator discretion.

The primary efficacy endpoint of the study was Invasive Disease Free Survival (IDFS). IDFS was defined as the time from the date of randomization to first occurrence of ipsilateral invasive breast tumour recurrence, ipsilateral local or regional invasive breast cancer recurrence, distant recurrence, contralateral invasive breast cancer, or death from any cause. Additional endpoints included IDFS including second primary non-breast cancer, disease free survival (DFS), overall survival (OS), and distant recurrence-free interval (DRFI).

Patient demographics and baseline tumour characteristics were balanced between treatment arms. The median age was approximately 49 years (range 23-80 years), 72.8% were White, 8.7% were Asian and 2.7% were Black or African American. All but 5 patients were women. 22.5 percent of patients were enrolled in North America, 54.2% in Europe and 23.3% throughout the rest of the world. Tumour prognostic characteristics including hormone receptor status (positive: 72.3%, negative: 27.7%), clinical stage at presentation (inoperable: 25.3%, operable: 74.8%) and pathological nodal status after preoperative therapy (node positive: 46.4%, node negative not evaluated: 53.6%) were similar in the study arms.

The majority of the patients (76.9%) had received an anthracycline-containing neoadjuvant chemotherapy regimen. 19.5% of patients received another HER2-targeted agent in addition to trastuzumab as a component of neoadjuvant therapy. Pertuzumab was the second therapy in 93.8% of patients who received a second neoadjuvant HER2-directed agent.

A clinically meaningful and statistically significant improvement in IDFS was observed in patients who received Kadcyla compared with trastuzumab (HR = 0.50, 95% CI [0.39, 0.64],  $p < 0.0001$ ), corresponding to a 50% reduction in risk of an IDFS event. Estimates of 3 years IDFS rates were 88.3% vs. 77.0% in Kadcyla vs. trastuzumab arms, respectively. See Table 8 and Figure 1.

**Table 8 Summary of Efficacy from BO27938 (KATHERINE) study**

	<b>Trastuzumab n = 743</b>	<b>Kadcyla n = 743</b>
<b>Primary Endpoint</b>		
<b>Invasive Disease Free Survival (IDFS)<sup>3</sup></b>		
Number (%) of patients with event	165 (22.2%)	91 (12.2%)

<sup>1</sup> Hierarchical testing applied for IDFS and OS

<sup>2</sup> 3-year event-free rate and 5 year survival rate derived from Kaplan-Meier estimates

<sup>3</sup> Data from first interim analysis

**Figure 1 Kaplan-Meier Curve of Invasive Disease Free Survival in KATHERINE**

In KATHERINE, consistent treatment benefit of Kadcyła for IDFS was seen in all the pre-specified subgroups evaluated, supporting the robustness of the overall result.

### Metastatic Breast Cancer

#### *TDM4370g/BO21977 (EMILIA)*

EMILIA is a phase III, randomised, multicentre, international, open-label clinical trial conducted in patients with HER2-positive unresectable, locally advanced breast cancer (LABC) or metastatic breast cancer who had received prior taxane and trastuzumab-based therapy, including patients who received prior therapy with trastuzumab and a taxane in the adjuvant setting and who relapsed within six months of completing adjuvant therapy. Prior to enrolment, breast tumour samples were centrally confirmed to be HER2 positive, defined as a score of 3+ by IHC or gene amplification by ISH. Baseline patient and tumour characteristics were well balanced between treatment groups. For patients randomised to Kadcyła, the median age was 53 years, most patients were female (99.8%), the majority Caucasian (72%), and 57% had oestrogen-receptor and/or progesterone-receptor positive disease. The study compared the safety and efficacy of Kadcyła with that of lapatinib + capecitabine. A total of 991 patients were randomised with Kadcyła or lapatinib + capecitabine as follows:

- Kadcyła 3.6 mg/kg IV over 30 - 90 minutes on Day 1 of a 21-day cycle, or
- Lapatinib 1250 mg/day orally once per day of a 21-day cycle + capecitabine 1000 mg/m<sup>2</sup> orally twice daily on Days 1 - 14 of a 21-day cycle

The co-primary efficacy endpoints of the study were progression-free survival (PFS) as assessed by an independent review committee (IRC), overall survival (OS) and landmark (1-year and 2-year) survival rates.

Time to symptom progression, as defined by a 5-point decrease in score derived from the trial outcome index-breast (TOI-B) subscale of the Functional Assessment of Cancer Therapy-

Breast Quality of Life (FACT-B QoL) questionnaire was also assessed during the clinical trial. A change of 5 points in the TOI-B is considered clinically significant.

**Table 9 Summary of efficacy from TDM4370g/BO21977 (EMILIA) study**

	<b>Lapatinib + Capecitabine n = 496</b>	<b>Kadcyla n = 495</b>
<b>Primary Endpoints</b>		
<b>IRC-assessed PFS</b>		
Number (%) of patients with event	304 (61.3%)	265 (53.5%)
Median duration of PFS (months)	6.4	9.6
Hazard Ratio (stratified <sup>a</sup> )	0.650	
95% CI for Hazard Ratio	(0.549, 0.771)	
p-value (Log-Rank test, stratified <sup>a</sup> )	<0.0001	
<b>Overall Survival <sup>b</sup></b>		
Number (%) of patients who died	182 (36.7%)	149 (30.1%)
Median duration of survival (months)	25.1	30.9
Hazard Ratio (stratified <sup>a</sup> )	0.682	
95% CI for Hazard Ratio	(0.548, 0.849)	
p-value (Log-Rank test <sup>a</sup> )	0.0006	
Landmark 1 year survival rate (95% CI)	78.4% (74.62, 82.26)	85.2% (81.99, 88.49)
Landmark 2 year survival rate (95% CI)	51.8% (45.92, 57.73)	64.7% (59.31, 70.19)
<b>Key Secondary Endpoints</b>		
<b>Investigator-assessed PFS</b>		
Number (%) of patients with event	335 (67.5%)	287 (58.0%)
Median duration of PFS (months)	5.8	9.4
HR (95% CI)	0.658 (0.560, 0.774)	
p-value (Log-Rank test <sup>a</sup> )	<0.0001	
<b>Objective Response Rate</b>		
Patients with measurable disease	389	397
Number of patients with OR (%)	120 (30.8%)	173 (43.6%)
Diff, (95% CI);	12.7% (6.0, 19.4)	
p-value (Mantel-Haenszel chi-squared test <sup>a</sup> )	0.0002	
<b>Duration of Objective Response (months)</b>		
Number of patients with OR	120	173
Median 95% CI	6.5 (5.5, 7.2)	12.6 (8.4, 20.8)
<b>Time to Symptom Progression</b>		
Number of evaluable patients	445	450
Number (%) of patients with event	257 (57.8%)	246 (54.7%)
Median time to event (months)	4.6	7.1
HR, 95% CI	0.796 (0.667, 0.951)	
p-value (Log-Rank test <sup>a</sup> )	0.0121	

PFS: progression-free survival; OR: objective response

<sup>a</sup> Stratified by: world region (United States, Western Europe, Other), number of prior chemotherapeutic regimens for locally advanced or metastatic disease (0-1 vs. > 1), and visceral vs. non-visceral disease.

<sup>b</sup> The first interim analysis of overall survival (OS) was performed at the time of primary PFS analysis. Strong treatment effect was observed, but pre-specified efficacy boundary was not crossed. A second interim analysis for OS was conducted when 331 OS events were observed and the results are presented in Table 9.

A treatment benefit was seen in the subgroup of patients who did not receive any prior systemic anti-cancer therapy in the metastatic setting (n=118); hazard ratio for PFS and OS were 0.51 (95% CI: 0.30, 0.85) and 0.61 (95% CI: 0.32, 1.16), respectively. The median PFS and OS for the Kadcyła group were 10.8 months and not reached, respectively, compared with 5.7 months and 27.9 months, respectively, for the lapatinib plus capecitabine group.

Of 495 patients who received Kadcyła in EMILIA, 65 patients (13%) were  $\geq 65$  years of age and 11 patients (2%) were  $\geq 75$  years of age. A trend for treatment benefit with Kadcyła compared to the control arm in terms of PFS for the subgroup of patients who were 65 to 74 years old was observed (total n=113; HR=0.88, 95% CI: 0.53, 1.45). For patients  $\geq 75$  years of age, based on IRC assessments, the hazard ratios for PFS and OS were 3.51 (95% CI: 1.22, 10.13) and 3.45 (95% CI: 0.94, 12.65), respectively. The subgroup of patients 75 years or above did not demonstrate a benefit for PFS or OS, but was too small (n=25) to draw any definitive conclusions.

**Figure 3 Kaplan-Meier curve of IRC-assessed progression-free survival**

Number at Risk:	0	2	4	6	8	10	12	14	16	18	20	22	24	26	28	30

Hazard ratio is estimated based on a stratified Cox model; p-value is estimated based on a stratified log-rank test.

#### *TDM4450g/BO21976*

TDM4450g was a randomised, multicentre, open-label phase II study to evaluate the effects of Kadcylla versus trastuzumab plus docetaxel in patients with HER2-positive metastatic breast cancer who had not received prior chemotherapy for metastatic disease. Patients were randomised to receive Kadcylla, 3.6 mg/kg IV every 3 weeks (n=67), or trastuzumab, 8 mg/kg IV loading dose, followed by 6 mg/kg IV, every 3 weeks + docetaxel 75-100 mg/m<sup>2</sup> IV every 3 weeks (n=70).

The primary endpoint was PFS assessed by the investigator. The median PFS was 9.2 months in the trastuzumab + docetaxel arm and 14.2 months in the Kadcylla arm (HR: 0.59; p=0.035), with a median follow-up of approximately 14 months in both arms. The ORR was 58.0% with trastuzumab + docetaxel and 64.2% with Kadcylla. The median duration of response was not reached with Kadcylla vs. median duration 9.5 months in the control arm.

The worsening of the FACT-B TOI scores was delayed in the Kadcylla arm compared with the control arm (median time to symptom progression was 7.5 months in the Kadcylla arm vs. 3.5 months in the control arm; HR: 0.58; p=0.022).

#### *TDM4374g*

TDM4374g was a phase II single-arm, open-label study to evaluate the effects of Kadcylla in patients with HER2 positive incurable, locally advanced, or metastatic breast cancer. All patients were previously treated with HER2-directed therapies (trastuzumab and lapatinib) and chemotherapy (anthracycline, taxane, and capecitabine) in the neoadjuvant, adjuvant, locally advanced, or metastatic setting. The median number of anti-cancer agents that patients received in any setting was 8.5 (range, 5–19) and in the metastatic setting was 7.0 (range, 3–17) including all agents intended for the treatment of breast cancer.

Patients (n=110) received 3.6 mg/kg of Kadcyla IV every 3 weeks until disease progression or unacceptable toxicity.

The key efficacy analyses were ORR based on independent radiologic review and duration of objective response. The ORR was 32.7% (95% CI: 24.1, 42.1), n=36 responders, by both IRC and investigator review. The median duration of response by Independent Review Committee was not reached (95% CI, 4.6 months to not estimable).

## 5.2 PHARMACOKINETIC PROPERTIES

The population pharmacokinetic analysis of trastuzumab emtansine suggested no difference in Kadcyla exposure based on disease status (adjuvant vs. metastatic setting).

### Absorption

Kadcyla is administered as an intravenous (IV) infusion. There have been no studies performed with other routes of administration.

### Distribution

Kadcyla when administered IV every 3 weeks exhibited linear pharmacokinetics across doses ranging from 2.4 to 4.8 mg/kg; patients who received doses less than or equal to 1.2 mg/kg had faster clearance.

Patients in the randomised pivotal trials, EMILIA and KATHERINE, who received 3.6 mg/kg of Kadcyla IV every 3 weeks, had a mean maximum serum concentration (C<sub>max</sub>) of trastuzumab emtansine in Cycle 1 of 83.4 ( $\pm$ 16.5)  $\mu$ g/mL and 72.6 ( $\pm$  24.3)  $\mu$ g/mL, respectively. Based on population pharmacokinetic analysis, following IV administration of Kadcyla, the central volume of distribution of trastuzumab emtansine was 3.13 L and approximated that of plasma volume.

In *in vitro* studies, DM1 was 93% bound to human plasma proteins and was shown to be a substrate of P-glycoprotein (P-gp).

### Metabolism

Kadcyla is expected to undergo catabolism by means of proteolysis in cellular lysosomes, with no significant involvement of cytochrome P450 isoenzymes. Catabolites including Lys-MCC-DM1, MCC-DM1 and DM1 are detected at low levels in human plasma. In the randomised trials EMILIA and KATHERINE, mean maximum DM1 levels in Cycle 1 following Kadcyla administration were consistently low and averaged 4.61 ( $\pm$  1.61) ng/mL and 4.71 ( $\pm$  2.25) ng/mL, respectively.

*In vitro* metabolism studies in human liver microsomes suggest that DM1, a component of trastuzumab emtansine, is metabolised mainly by CYP3A4, and to a lesser extent by CYP3A5.

### Excretion

Based on population pharmacokinetic analysis, following IV administration of Kadcyla, the clearance of trastuzumab emtansine was 0.68 L/day and the elimination half-life (t<sub>1/2</sub>) was approximately 4 days. No accumulation of trastuzumab emtansine was observed after repeated dosing of Kadcyla IV infusions every 3 weeks.

Based on population pharmacokinetic analysis (n=671), body weight, albumin, sum of longest diameter of target lesions by Response Evaluation Criteria in Solid Tumours (RECIST), HER2 shed ECD, baseline trastuzumab concentrations, and AST were identified as statistically

significant covariates for trastuzumab emtansine pharmacokinetic parameters. However, the magnitude of effect of these covariates on trastuzumab emtansine exposure, suggests that, with the exception of body weight, these covariates are unlikely to have any clinically meaningful effect on Kadcyła exposure. Therefore, the body weight based dose of 3.6 mg/kg every 3 weeks without correction for other covariates is considered appropriate.

In rats, trastuzumab emtansine catabolites, including DM1, Lys-MCC-DM1, and MCC-DM1 were shown to be mainly excreted in the bile with minimal elimination in urine.

### **Pharmacokinetics in special populations**

The population pharmacokinetic analysis of trastuzumab emtansine showed that race did not appear to influence the pharmacokinetics of Kadcyła. Pharmacokinetics of Kadcyła in Asian patients (n=73) were similar to non-Asian patients (n=598). Because most of the patients in Kadcyła clinical studies were females, effect of gender on the pharmacokinetics of Kadcyła was not formally evaluated.

#### Elderly

The population pharmacokinetic analysis of trastuzumab emtansine showed that age did not affect the pharmacokinetics of Kadcyła. No significant difference was observed in the pharmacokinetics of trastuzumab emtansine among patients <65 years (n=577), patients between 65-75 years (n=78) and patients >75 years (n=16).

#### Renal Impairment

The population pharmacokinetic analysis of trastuzumab emtansine showed that creatinine clearance (CL<sub>cr</sub>) does not affect pharmacokinetics of Kadcyła. Pharmacokinetics of trastuzumab emtansine in patients with mild (CL<sub>cr</sub> 60-89 mL/min, n=254) or moderate (CL<sub>cr</sub> 30 to 59 mL/min, n=53) renal impairment were similar to those in patients with normal renal function (CL<sub>cr</sub> ≥90 mL/min, n=361). Pharmacokinetic data in patients with severe renal impairment (CL<sub>cr</sub> 15-29 mL/min) is limited (n=1), therefore no dosage recommendations can be made.

#### Hepatic Impairment

The liver is a primary organ for eliminating DM1 and DM1-containing catabolites. The pharmacokinetics of trastuzumab emtansine and DM1-containing catabolites were evaluated after the administration of 3.6 mg/kg of Kadcyła to metastatic HER2-positive breast cancer patients with normal hepatic function (n=10), mild (Child-Pugh A; n=10) and moderate (Child-Pugh B; n=8) hepatic impairment.

- Plasma concentrations of DM1 and MCC-DM1 were low and comparable between patients with and without hepatic impairment. Plasma concentrations of Lys-MCC-DM1 were minimal in subjects with and without hepatic impairment.
- Systemic exposures (AUC) of trastuzumab emtansine at Cycle 1 in patients with mild and moderate hepatic impairment were approximately 38% and 67% lower than that of patients with normal hepatic function, respectively. Trastuzumab emtansine exposure (AUC) at Cycle 3 after repeated dosing in patients with mild hepatic dysfunction was 14% lower than in patients with normal hepatic function. There are insufficient data to characterise trastuzumab emtansine exposure beyond Cycle 1 in patients with moderate hepatic impairment.

No formal pharmacokinetic study has been conducted and no population PK data was collected in patients with severe hepatic impairment (Child-Pugh class C).

### **5.3 PRECLINICAL SAFETY DATA**

#### **Genotoxicity**

A limited monkey micronucleus assay did not identify any clastogenic potential for trastuzumab emtansine. While DM1 did not demonstrate any mutagenic potential in the bacterial reverse mutation (Ames test) *in vitro*, it was shown to be dose-dependently clastogenic in the rat micronucleus assay *in vivo* at anticipated therapeutic DM1 exposure levels.

#### **Carcinogenicity**

No studies have been performed to establish the carcinogenic potential of Kadcyła.

## **6. PHARMACEUTICAL PARTICULARS**

### **6.1 LIST OF EXCIPIENTS**

Succinic acid

Sodium hydroxide

Sucrose

Polysorbate 20

### **6.2 INCOMPATIBILITIES**

Dextrose (5%) solution should not be used since it causes aggregation of the protein.

Kadcyła should not be mixed or diluted with other drugs.

### **6.3 SHELF LIFE**

In Australia, information on the shelf life can be found on the public summary of the Australian Register of Therapeutic Goods (ARTG). The expiry date can be found on the packaging.

### **6.4 SPECIAL PRECAUTIONS FOR STORAGE**

#### **Storage conditions**

Store vials in a refrigerator at 2-8°C. Do not use after the expiry date (EXP) shown on the pack.

#### **Shelf-life of reconstituted solution**

Kadcyła vials reconstituted with Sterile Water for Injection (SWFI) should be used immediately following reconstitution. If not used immediately, the reconstituted vials can be stored for up to 24 hours at 2-8°C, and must be discarded thereafter.

Do not freeze the reconstituted solution.

#### **Shelf-life of solution for infusion containing the reconstituted product**

The reconstituted Kadcyła solution diluted in polyvinyl chloride (PVC) or latex-free PVC-free polyolefin bags containing 0.9% Sodium Chloride Injection, or 0.45% Sodium Chloride Injection, may be stored at 2-8°C for up to 24 hours prior to use. Particulates may be observed on storage if diluted in 0.9% Sodium Chloride Injection, therefore, a 0.22 micron in-line polyethersulfone (PES) filter is required for administration (*see Section 4.2 Dose and method of administration*).

Do not freeze the solution for infusion containing the reconstituted product.

## 6.5 NATURE AND CONTENTS OF CONTAINER

Available in single-use glass vials containing 100 mg or 160 mg of Kadcyła powder for concentrate solution, designed to deliver 5 mL or 8 mL respectively, of 20 mg/mL of trastuzumab emtansine.

## 6.6 SPECIAL PRECAUTIONS FOR DISPOSAL AND OTHER HANDLING

### Instructions for reconstitution

Appropriate aseptic technique should be used. Appropriate procedures for the preparation of chemotherapeutic drugs should be used.

The reconstituted product does not contain preservative and is for single use in one patient only. Discard any residue.

- Using a sterile syringe, slowly inject 5 mL of SWFI into the 100 mg vial, or 8 mL of SWFI into the 160 mg vial.
- Swirl the vial gently until completely dissolved. **DO NOT SHAKE!**

Reconstituted solution should be inspected visually for particulate matter and discolouration prior to administration. The reconstituted solution should be free of visible particulates, clear to slightly opalescent. The colour of the reconstituted solution should be colourless to pale brown. Do not use if the reconstituted solution contains visible particulates, is cloudy or discoloured.

### Instructions for dilution

Determine the volume of solution required based on a dose of 3.6 mg Kadcyła / kg body weight (*see section 4.2 Dose and method of administration; Dose Adjustment*):

**Volume (mL) =  $\frac{\text{Body weight (kg)} \times \text{dose (mg/kg)}}{20 \text{ mg/mL (conc. of reconstituted solution)}}$**

**20 mg/mL (conc. of reconstituted solution)**

The appropriate amount of solution should be withdrawn from the vial and added to an infusion bag containing 250 ml of 0.45% sodium chloride or 0.9% sodium chloride. Dextrose (5%) solution should not be used.

### Disposal

The release of medicines into the environment should be minimised. Medicines should not be disposed of via wastewater and disposal through household waste should be avoided. In Australia, any unused medicine or waste material should be disposed of by taking to your local pharmacy.

## 6.7 PHYSICOCHEMICAL PROPERTIES

### Chemical structure

Note: The bracketed structure is DM1 plus MCC which represents the emtansine component. The n is, on average, 3.5 DM1 molecules per trastuzumab (Mab) molecule.

Kadcyla (trastuzumab emtansine) is a HER2-targeted antibody-drug conjugate that contains the humanised anti-HER2 IgG1, trastuzumab, covalently linked to the microtubule inhibitory drug DM1 (a maytansine derivative) with the stable thioether linker MCC (4-[N-maleimidomethyl] cyclohexane-1-carboxylate). Emtansine refers to the MCC-DM1 complex. The antibody trastuzumab, is a well characterised recombinant monoclonal antibody product produced by mammalian (Chinese hamster ovary) cells, and the small molecule components (DM1 and MCC) are produced by chemical synthesis. An average of 3.5 DM1 molecules are conjugated to each molecule of trastuzumab.

### CAS number
